

Principles of Disease and Epidemiology

Normal Microbiota

Normal Microbiota

Table 14.1 Representative Normal Microbiota by Body Region

Region	Principal Components	Comments
Skin	<i>Propionibacterium</i> , <i>Staphylococcus</i> , <i>Corynebacterium</i> , <i>Micrococcus</i> , <i>Acinetobacter</i> , <i>Brevibacterium</i> ; <i>Pityrosporum</i> (fungus), <i>Candida</i> (fungus), <i>Malassezia</i> (fungus)	<ul style="list-style-type: none"> Most of the microbes in direct contact with skin do not become residents because secretions from sweat and oil glands have antimicrobial properties. Keratin is a resistant barrier, and the low pH of the skin inhibits many microbes. The skin also has a relatively low moisture content.
Eyes (Conjunctiva)	<i>Staphylococcus epidermidis</i> , <i>S. aureus</i> , diphtheroids, <i>Propionibacterium</i> , <i>Corynebacterium</i> , streptococci, <i>Micrococcus</i>	<ul style="list-style-type: none"> The conjunctiva, a continuation of the skin or mucous membrane, contains basically the same microbiota found on the skin. Tears and blinking also eliminate some microbes or inhibit others from colonizing.

Normal Microbiota

Table 14.1

(continued)

Region	Principal Components	Comments
Nose and Throat (Upper Respiratory System)	<i>Staphylococcus aureus</i> , <i>S. epidermidis</i> , and aerobic diphtheroids in the nose; <i>S. epidermidis</i> , <i>S. aureus</i> , diphtheroids, <i>Streptococcus pneumoniae</i> , <i>Haemophilus</i> , and <i>Neisseria</i> in the throat	<ul style="list-style-type: none"> Although some normal microbiota are potential pathogens, their ability to cause disease is reduced by microbial antagonism. Nasal secretions kill or inhibit many microbes, and mucus and ciliary action remove many microbes.
Mouth	<i>Streptococcus</i> , <i>Lactobacillus</i> , <i>Actinomyces</i> , <i>Bacteroides</i> , <i>Veillonella</i> , <i>Neisseria</i> , <i>Haemophilis</i> , <i>Fusobacterium</i> , <i>Treponema</i> , <i>Staphylococcus</i> , <i>Corynebacterium</i> , and <i>Candida</i> (fungus)	<ul style="list-style-type: none"> Abundant moisture, warmth, and the constant presence of food make the mouth an ideal environment that supports very large and diverse microbial populations on the tongue, cheeks, teeth, and gums. However, biting, chewing, tongue movements, and salivary flow dislodge microbes. Saliva contains several antimicrobial substances.
Large Intestine	<i>Escherichia coli</i> , <i>Bacteroides</i> , <i>Fusobacterium</i> , <i>Lactobacillus</i> , <i>Enterococcus</i> , <i>Bifidobacterium</i> , <i>Enterobacter</i> , <i>Citrobacter</i> , <i>Proteus</i> , <i>Klebsiella</i> , <i>Candida</i> (fungus)	<ul style="list-style-type: none"> The large intestine contains the largest numbers of resident microbiota in the body because of its available moisture and nutrients. Mucus and periodic shedding of the lining prevent many microbes from attaching to the lining of the gastrointestinal tract, and the mucosa produces several antimicrobial chemicals. Diarrhea also flushes out some of the normal microbiota.
Urinary and Reproductive Systems	<i>Staphylococcus</i> , <i>Micrococcus</i> , <i>Enterococcus</i> , <i>Lactobacillus</i> , <i>Bacteroides</i> , aerobic diphtheroids, <i>Pseudomonas</i> , <i>Klebsiella</i> , and <i>Proteus</i> in urethra; lactobacilli, <i>Streptococcus</i> , <i>Clostridium</i> , <i>Candida albicans</i> (fungus), and <i>Trichomonas vaginalis</i> (protozoan) in vagina	<ul style="list-style-type: none"> The lower urethra in both sexes has a resident population; the vagina has its acid-tolerant population of microbes because of the nature of its secretions. Mucus and periodic shedding of the lining prevent microbes from attaching to the lining; urine flow mechanically removes microbes, and the pH of urine and urea are antimicrobial. Cilia and mucus expel microbes from the cervix of the uterus into the vagina, and the acidity of the vagina inhibits or kills microbes.

Terminology

Table 14.2 Selected Zoonoses				
Disease	Causative Agent	Reservoir	Transmission Due To	Chapter Reference
Viral				
Influenza (some types)	<i>Influenzavirus</i>	Swine, birds	Direct contact	24
Rabies	<i>Lyssavirus</i>	Bats, skunks, foxes, dogs, raccoons	Direct contact (bite)	22
West Nile encephalitis	<i>Flavivirus</i>	Horses, birds	<i>Aedes</i> and <i>Culex</i> mosquito bite	22
<i>Hantavirus</i> pulmonary syndrome	<i>Hantavirus</i>	Rodents (primarily deer mice)	Direct contact with rodent saliva, feces, or urine	23
Bacterial				
Anthrax	<i>Bacillus anthracis</i>	Domestic livestock	Direct contact with contaminated hides or animals; air; food	23
Brucellosis	<i>Brucella</i> spp.	Domestic livestock	Direct contact with contaminated milk, meat, or animals	23
Plague	<i>Yersinia pestis</i>	Rodents	Flea bites	23
Cat-scratch disease	<i>Bartonella henselae</i>	Domestic cats	Direct contact	23
Ehrlichiosis	<i>Ehrlichia</i> spp.	Deer, rodents	Tick bites	23
Leptospirosis	<i>Leptospira</i>	Wild mammals, domestic dogs and cats	Direct contact with urine, soil, water	26
Lyme disease	<i>Borrelia burgdorferi</i>	Field mice	Tick bites	23
Psittacosis (ornithosis)	<i>Chlamydophila psittaci</i>	Birds, especially parrots	Direct contact	24
Rocky Mountain spotted fever	<i>Rickettsia rickettsii</i>	Rodents	Tick bites	23
Salmonellosis	<i>Salmonella enterica</i>	Poultry, reptiles	Ingestion of contaminated food and water and putting hands in mouth	25
Endemic typhus	<i>Rickettsia typhi</i>	Rodents	Flea bites	23
Fungal				
Ringworm	<i>Trichophyton</i> <i>Microsporum</i> <i>Epidermophyton</i>	Domestic mammals	Direct contact; fomites (nonliving objects)	21
Protozoan				
Malaria	<i>Plasmodium</i> spp.	Monkeys	<i>Anopheles</i> mosquito bite	23
Toxoplasmosis	<i>Toxoplasma gondii</i>	Cats and other mammals	Ingestion of contaminated meat or by direct contact with infected tissues or fecal matter	23
Helminthic				
Tapeworm (pork)	<i>Taenia solium</i>	Pigs	Ingestion of undercooked contaminated pork	25
Trichinellosis	<i>Trichinella spiralis</i>	Pigs, bears	Ingestion of undercooked contaminated pork	25
